1. Scope
This product specification has been prepared to specify the rechargeable lithium-ion cell ('cell') to be supplied to the customer by Samsung SDI Co., Ltd.

2. Description and Model
2.1 Description Cell (lithium-ion rechargeable cell)
2.2 Model INR18650-29E
2.3 Site Manufactured in China & Korea

3. Nominal Specifications

Note : Item 3.1~3.10 shall follow “7. INR18650-29E Performance Usable Range”
4. Outline Dimensions

See the Fig. 1

![Diagram of INR18650-29E battery dimensions]

**Fig. 1 Outline Dimensions of INR18650-29E**
5. Appearance

There shall be no such defects as scratch, rust, discoloration, leakage which may adversely affect commercial value of the cell.

5.1 2D Marking

(1) Purpose
- To reinforce detecting cell defects through comparing OCV & IR before pack manufacturing
  → Check the difference of OCV/IR between OCV/IR of 2D barcode and OCV/IR of customer sorting.
- To improve traceability

(2) 2D Marking Information
- Cell batch number & Serial number (for SDI Internal)
- IR/OCV in outgoing inspection (for Customers)

(3) Size & Location
- Size: 6.5mm * 6.5mm (± 1mm)
- Location: 40 ± 2mm

## 8-2. Pack Design Guideline (For mechanical design)

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| ☐ Thermal Runaway Design → Module Design Checking | 1. The purpose of gap between each cell in battery pack is;  
   1) to minimize risk of fire of adjacent battery cells  
   2) to prevent degradation of cell or CID open due to exposure on high temperature through facilitating heat emission  
   → At least 2.0mm gap between each cell must be maintained.  
   2. Cell core case shall not be flamed.  
   → Cell core case must be non-flammable level V0 (or above V0). |
| ☐ Current Distribution Design → Module Design Checking | Basically, battery pack for xEV is composed of significant amount of cylindrical battery cells by serial-parallel.  
   With this significant serial-parallel structure, level of cycle life, heat, voltage imbalance at charging or discharging, and safety level will be effected by current distribution design of the battery pack.  
   → The current distribution design of pack must enable even distribution of current on each cell when charging/discharging. |
| ☐ Heat Generation (Ni Tab & Cell Body) → 1.0C to 2.0C Discharging Test | Abnormal heat source from the welding material can damage the battery (thermal damage). This phenomenon can cause safety or charging/discharging efficiency issues.  
   → The temperature between the welding material and battery cell body must be under 10degC at maximum continuous discharge. |
| ☐ Non Soldering Design                          | If battery cell is soldered, this can cause leakage of cell or unpredictable defect due to thermal damage.  
   → Soldering is PROHIBITED. Samsung SDI will NOT be liable for any defects caused by customer’s misuse of the battery cells (including soldering). |
| ☐ Thermal Imbalance Check                      | Thermal management for Li-ion battery pack of xEV that is composed of significant amount of cylindrical Li-ion battery cell is very important.  
   If the customer fails to equalize temperature in the battery pack, this can cause abnormal degradation of cycle life, imbalance, or inefficiency of charging/discharging.  
   → The temperature difference between the center of the battery pack and each side of the pack must be below 5℃ when charging, and under 10℃ when discharging, which must be facilitated through proper thermal management. |
| ☐ BOL Charging Imbalance Check                 | ※ If needed, Samsung SDI can request and check thermal distribution record of xEV pack and voltage imbalance data during pack charging/discharging from the customers. |
| ☐ BOL Discharging Imbalance Check              | ※ If needed, Samsung SDI can request and check thermal distribution record of xEV pack and voltage imbalance data during pack charging/discharging from the customers. |

- **Samsung SDI may, at any time, conduct module or pack analyses at the customer’s site to check the customer’s compliance with the above specifications. The customer must provide all necessary assistance to Samsung SDI.**

- **If the parties are unable to resolve issues found during such site inspection, Samsung SDI may refuse to supply further products to the customer.**
9. xEV Charging guide (Low Temp, Heating & Regeneration Charging)

- The above condition must be complied with when low temperature charging, heating, and regeneration charging of the cylindrical Li-ion battery for xEV.

- If the customer anticipates any problems in meeting the above conditions, customer must immediately notify Samsung SDI, and the parties will discuss.
10. Charging & Driving Mode Cooling Guide

- The above conditions must be complied with, when cooling at charging or at driving mode of the cylindrical Li-ion battery for xEV.

- If the customer anticipates any problems in meeting the above conditions, customer must immediately notify Samsung SDI, and the parties will discuss.
11. Cell Sorting Guideline

- Cell Stock Condition: Temp 25±3°C, Humidity less than 60%
- Batch Mixing: 1 Month (30 days)
- 1st Pack Charging Imbalance Voltage: Less than 15mV

12. Standard Test Conditions

12.1 Environmental Conditions
Unless otherwise specified, all tests stated in this specification are conducted at temperature 25±3°C and humidity under 60%.

12.2 Measuring Equipment
(1) Amp-meter and Volt-meter
The amp-meter and volt-meter should have an accuracy of the grade 0.5mA and mV or higher.
(2) Slide caliper
The slide caliper should have 0.01 mm scale.
(3) Impedance meter
The impedance meter with AC 1kHz should be used.

13. Characteristics

13.1 Standard Charge
This "Standard Charge" means charging the cell with charge current of 0.33C(825mA) and constant voltage 4.125V at 25°C, 0.025C(62.5mA) cutoff.

13.2 Standard Discharge Capacity
The standard discharge capacity is the initial discharge capacity of the cell, which is measured with discharge current of 1C(2,500mA) with 2.50V cut-off at 25°C within 1 hour after the Standard charge.

\[
\text{Standard Discharge Capacity} \geq 2,500 \text{mAh}
\]

13.3 Initial internal impedance
Initial internal impedance is measured at AC 1kHz after Standard charge.

\[
\text{Initial internal impedance} = 21 \pm 4 \text{mΩ}
\]
13.4 Temperature Dependence of Discharge Capacity
Discharge capacity comparison at each temperature, measured with discharge constant current 1C(2,500mA) and each cut-off voltage with follow temperature after the Standard charging at 25°C.

<table>
<thead>
<tr>
<th>Charge temperature</th>
<th>Discharge temperature</th>
</tr>
</thead>
<tbody>

<td>-20°C</td>
</tr>
<tr>
<td>Cut-off voltage</td>
<td>2.0V</td>
</tr>
<tr>
<td>Relative capacity</td>
<td>70%</td>
</tr>
</tbody>
</table>

Note: If charge temperature and discharge temperature is not the same, the interval for temperature change is 2 hours. Percentage as an index of the Standard discharge capacity (=2,500mAh) is 100%.

13.5 Temperature Dependence of Charge Capacity
Capacity comparison at each temperature, measured with discharge constant current 1C(2,500mA) and 2.50V cut-off at 25°C after the Standard charge is as follow temperature.

<table>
<thead>
<tr>
<th>Charge temperature</th>
<th>Discharge temperature</th>
</tr>
</thead>
<tbody>
<tr>
<td>0°C</td>
<td>10°C</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Note: If charge temperature and discharge temperature is not the same, the interval for temperature change is 2 hours. Percentage as an index of the Standard discharge capacity (=2500mAh) is 100%.

13.6 Charge Rate Capabilities
Discharge capacity is measured with constant current 1C(2,500mA) and 2.50V cut-off after the cell is charged with 4.125V at 25°C as follows.

<table>
<thead>
<tr>
<th>Charge Condition</th>
<th>0.33C (825mA)</th>
<th>0.5C (1250mA)</th>
<th>1.0C (2500mA)</th>
</tr>

<td>0.025C</td>
</tr>
<tr>
<td>Relative Capacity</td>
<td>100%</td>
<td>100%</td>
<td>95%</td>
</tr>
</tbody>
</table>

Note: Percentage as an index of the Standard discharge capacity (=2500mAh) is 100%.
13.7 Discharge Rate Capabilities
Discharge capacity is measured with the various currents in under table and 2.50V cut-off after the Standard charge at 25°C.

<table>
<thead>
<tr>
<th>Current</th>
<th>Discharge Condition</th>
<th>0.33C (825mA)</th>
<th>0.5C (1250mA)</th>
<th>1C (2,500mA)</th>

<td>100%</td>
<td>100%</td>
<td>90%</td>
<td></td>
</tr>
</tbody>
</table>

Note: Percentage as an index of the Standard discharge capacity (=2,500mAh) is 100%.

13.8 Cycle Life
Each cycle is an interval between the charge (charge current 0.33C(825mA) )with 0.025C cut-off and the discharge (discharge current 1C(2500mA) with 2.50V cut-off. Capacity after 1000 cycles.

Capacity ≥ 2,000mAh (80% of Standard discharge capacity)

13.9 Storage Characteristics 1
After storage for 7days at 55±2 °C with the standard charge, capacity after storage for 5hr at RT is measured with discharge current 1C(2500mA) with 2.50V cut-off at 25°C.

Capacity recovery(after the storage) ≥ 2,250mAh (90% of Standard discharge capacity)

13.10 Storage Characteristics 2
After storage for 28days at RT with the standard charge, capacity is measured with discharge current 1C(2500mA) with 2.50V cut-off at 25°C.

Capacity recovery(after the storage) ≥ 2,250mAh (90% of Standard discharge capacity)

13.11 Status of the cell as of ex-factory
The cell should be shipped in 3.450~3.650V Charging voltage range.
14. Safety

≠ GB/T 31484 31485 31486 Certificate, UN38.3

15. Warranty

Samsung SDI warrants that the battery products will be free from defects in manufacturing for a period of twenty four (24) months from the date of shipping. In case of defects, Samsung SDI will replace the affected battery cells, provided that Samsung SDI will not be liable for any defects which are caused by customer or any other person’s misuse or mishandling of the products (including any non-compliance with the handling / use instructions provided by Samsung SDI hereunder), or any malfunction of the equipments to which Samsung SDI’s products are incorporated. Samsung SDI’s standard warranty policy shall apply.

16. Others

16.1 Storage for a long time
    If the cell is kept for a long time (3months or more), It is strongly recommended that the cell is preserved at dry and low-temperature.

16.2 Other
    Any matters that specifications does not have, should be conferred with between the both parties.
Proper Use and Handling of Lithium Ion Cells
See before using lithium-ion cell

This document has been prepared to describe the appropriate cautions and prohibitions, which the customer should take or employ when the customer uses and handles the lithium ion cell to be manufactured and supplied by Samsung SDI Co., Ltd., in order to obtain optimum performance and safety.

1. Charging

1.1 Charging current
Charging current should be less than maximum charge current specified in the product specification.

1.2 Charging voltage
Charging should be done by voltage less than that specified in the product specification.

1.3 Charging time
Continuous charging under specified voltage does not cause any loss of performance characteristics. However, the charge timer is recommended to be installed from a safety consideration, which shuts off further charging at time specified in the product specification.

1.4 Charging temperature
The cell should be charged within a range of specified temperatures in the specification.

1.5 Reverse charging
The cell should be connected, confirming that its poles are correctly aligned. Inverse charging should be strictly prohibited. If the cell is connected improperly, it may be damaged.

2. Discharging

2.1 Discharging
The cell shall be discharged continuously at less than maximum discharge current specified in the product specification. In case of the higher discharge current should be set, it shall be discussed together with SDI.

2.2 Discharging temperature
2.2.1 The cell should be discharged within a range of temperatures specified in the product specification.
2.2.2 Otherwise, it may cause loss of characteristics.
2.3 Over-discharging
   2.3.1 The system should be equipped with a device to prevent further discharging exceeding discharging cut-off voltage specified in the product specification.
   2.3.2 Over-discharging may cause loss of performance, characteristics of battery function.
   2.3.3 Over-discharging may occur by self-discharge if the battery is left for a very long time without any use.
   2.3.4 The charger should be equipped with a device to detect cell voltage and to determine recharging procedures.

3. Storage

3.1 Storage conditions
   3.1.1 The cell should be stored within a range of temperatures specified in the product specification.
   3.1.2 Otherwise, it may cause loss of performance characteristics, leakage and/or rust.

3.2 Long-term storage
   3.2.1 The cell should be used within a short period after charging because long-term storage may cause loss of capacity by self-discharging.
   3.2.2 Store the battery at 0 ~ 25℃, low humidity (below 60%), no dust and no corrosive gas atmosphere.

4. Cycle life

4.1 Cycle life performance
   4.1.1 The cell can be charged/discharged repeatedly up to times specified in the produce specification with a certain level of capacity also specified in the product specification.
   4.1.2 Cycle life may be determined by conditions of charging, discharging, operating temperature and/or storage.

5. Battery Pack Assembly

5.1 Prohibition of usage of damaged cell
   5.1.1 The cell should be inspected visually before battery assembly.
   5.1.2 The cell should not be used if sleeve-damage, can-distortion and/or electrolyte-smell is detected.

5.2 Terminals handling
   5.2.1 Excessive force on the negative terminal should be avoided when external strip terminal is welled.
5.3 Transportation
5.3.1 If the cell is necessary to be transported to such as the battery manufacturer, careful precautions should be taken to avoid damage of cell.

6. Others

6.1 Disassembly
6.1.1 The cell should not be dismantled from the battery pack.
6.1.2 Internal short-circuit caused by disassembly may lead to heat generation and/or venting.
6.1.3 When the electrolyte is coming in contact with the skin or eyes, wash immediately with fresh water and seek medical advice.

6.2 Short-circuiting
6.2.1 Short-circuit results in very high current which leads to heat generation.
6.2.2 An appropriate circuitry should be employed to protect accidental short-circuiting.

6.3 Incineration
6.3.1 Incinerating and disposing of the cell in fire are strictly prohibited, because it may cause rupture and explosion.

6.4 Immersion
6.4.1 Soaking the cell in water is strictly prohibited, because it may cause corrosion and leakage of components to be damaged to functions.

6.5 Mixing use
6.5.1 Different types of cell, or same types but different cell manufacturer's shall not be used, which may lead to cell imbalance, cell rupture or damage to system due to the different characteristics of cell.
6.5.2 Do not mix use the cells from different batches/ranks even they are the same cell types from the same manufacturer.

6.6 Battery disposal
6.6.1 Although the cell contains no environmentally hazardous component, such as lead or cadmium, the battery should be disposed according to the local regulations when it is disposed.
6.6.2 The cell should be disposed with a discharged state to avoid heat generation by an inadvertent short-circuit.

6.7 Caution
6.7.1 The Battery used in this device may present a risk of fire or chemical burn if mistreated.
6.7.2 Do not disassemble, expose to heat above 100℃ or incinerate it.
6.7.3 Replace battery with Samsung SDI battery only.
6.7.4 Use of another battery may present a risk of fire or explosion.
6.7.5 Dispose of used battery promptly.
6.7.6 Keep away from children.
6.7.7 Do not disassemble and do not dispose of in fire.
Handling precaution and prohibitions of lithium rechargeable cells and batteries

Inaccurate handling of lithium ion and lithium ion batteries rechargeable battery may cause leakage, heat, smoke, an explosion, or fire. This could cause deterioration of performance or failure. Please be sure to follow instructions carefully.

1. Safety precaution and prohibitions
To assure product safety, describe the following precautions in the instruction manual of the application.

2. Danger

2.1 Electrical misusage
   2.1.1 Use dedicated charger.
   2.1.2 Use or charge the battery only in the dedicated application.
   2.1.3 Don't charge the battery by an electric outlet directly or a cigarette lighter charger.
   2.1.4 Don't charge the battery reversely.

2.2 Environmental misusage
   2.2.1 Don't leave the battery near the fire or a heated source.
   2.2.2 Don't throw the battery into the fire.
   2.2.3 Don't leave, charge or use the battery in a car or similar place where inside of temperature may be over 60°C.
   2.2.4 Don't immerse, throw, wet the battery in water / seawater.

2.3 Others
   2.3.1 Don't fold the battery cased with laminated film such as pouch and Polymer.
   2.3.2 Don't store the battery in a pocket or a bag together with metallic objects such as keys, necklaces, hairpins, coins, or screws.
   2.3.3 Don't short circuit (+) and (-) terminals with metallic object intentionally.
   2.3.4 Don't pierce the battery with a sharp object such as a needle, screw drivers.
   2.3.5 Don't heat partial area of the battery with heated objects such as soldering iron.
   2.3.6 Don't hit with heavy objects such as a hammer, weight.
2.3.7 Don't step on the battery and throw or drop the battery on the hard floor to avoid mechanical hock.
2.3.8 Don't disassemble the battery or modify the battery design including electric circuit.
2.3.9 Don't solder on the battery directly.
2.3.10 Don't use seriously scared or deformed battery.
2.3.11 Don't put the battery into a microwave oven, dryer, or high-pressure container.
2.3.12 Don't use or assemble the battery with other makers' batteries, different types and/or models of batteries such as dry batteries, nickel-metal hydride batteries, or nickel-cadmium batteries.
2.3.13 Don't use or assemble old and new batteries together.

3. Warning
3.1 Stop using the battery if the battery becomes abnormally hot, order, discoloration, deformation, or abnormal conditions is detected during use, charge, or storage.
3.2 Keep away from fire immediately when leakage or foul odors are detected. If liquid leaks onto your skin or cloths, wash well with fresh water immediately.
3.3 If liquid leaking from the battery gets into your eyes, don't rub your eyes and wash them with clean water and go to see a doctor immediately.
3.4 If the terminals of the battery become dirty, wipe with a dry cloth before using the battery.
3.5 Cover terminals with proper insulating tape before disposal.

4. Caution
4.1 Electrical misusage
Battery must be charge with constant current-constant voltage (CC/CV).

4.2 Others
4.2.1 Keep the battery away from babies and children to avoid any accidents such as swallow.
4.2.2 If younger children use the battery, their guardians should explain the proper handling method and precaution before using.
4.2.3 Before using the battery, be sure to read the user's manual and precaution of its handling.
4.2.4 Before using charger, be sure to read the user's manual of the charger.
4.2.5 Before installing and removing the battery from application, be sure to read user's manual of the application.
4.2.6 Replace the battery when using time of battery becomes much shorter than usual.
4.2.7 Cover terminals with insulating tape before proper disposal.
4.2.8 If the battery is needed to be stored for a long period, battery should be removed from the application and stored in a place where humidity and temperature are low.
4.2.9 While the battery is charged, used and stored, keep it away from object materials with static electric chargers.

5. Safety Handling Procedure for the Transporter

5.1 Quarantine
Packages that are crushed, punctured or torn open to reveal contents should not be transported. Such packages should be isolated until the shipper has been consulted, provided instructions and, if appropriate, arranged to have the product inspected and repacked.

5.2 Spilled Product
In the event that damage to packaging results in the release of cells or batteries, the spilled products should be promptly collected and segregated and the shipper should be contacted for instructions.
Samsung SDI emergency contact information

- **Samsung SDI Co., Ltd (Headquarter)**
  150-20, Gongse-ro, Giheung-gu, Yongin-si, Gyunggi-do, Korea
  Tel: +82-31-8006-3100, Fax : +82-31-210-7887

- **Samsung SDI Co., Ltd (Cheonan Factory, Production)**
  467, Beonyeong-ro, Seobuk-gu, Cheonan-si, Chungcheongnam-Do, Korea
  Tel: +82-41-560-3114, Fax : +82-41-550-3399

- **Samsung SDI China Co., Ltd (Tianjin Factory, Production)**
  301726, China Tianjin Developing Zone OF Yi-Xian Park, Wuqing Country, TianJin, China
  Tel: +86-22-8212-9971(5300),

- **Samsung SDI Energy Malaysia SDN. Bhd. (Malaysia Factory, Production)**
  Lot 635 & 660, Kawasan Perindustrian, Tuanku Jaafar, 71450 Sungai Gadut, Negeri Sembilan Darul Khusus, Malaysia
  Tel: (+60)6-677-6160, 6153, Fax: (+60)6-677-6164

- **Samsung SDI America, Inc (San Jose, Sales)**
  3655 North First St. San Jose CA 95134
  Tel: +1-408-544-4541, Fax: +1-949-260-2221

- **Samsung SDI Europe GmbH (Munich, Sales)**
  85737, Oskar-Messter-Strasse 29 Ismaning, Germany
  Tel: +49-89-9292-7799(20), Fax: +49-89-9292-7799(99)

- **Samsung SDI Japan Co., Ltd (Tokyo, Sales)**
  108-0075, Shinagawa Grand Central Tower 9F, 2-16-4, Konan, Minato-ku, Tokyo, Japan
  Tel. +81-3-6369-6401, +81-3-6369-6404 Fax. +81-3-6369-6388
